

EXPERIMENT 7

Name: Divya S

Rollno: 240701128

AIM:

To design a simple mobile app interface and experiment with different color schemes to evaluate user preferences based on aesthetics and usability.

PROCEDURE:

1. A new canvas of size **1080 × 1920 pixels** was created in GIMP to design a mobile app interface.
2. The screen was divided into three sections:
 - Header
 - Content area
 - Footer
3. Basic UI elements were added, including:
 - App title “Smartlife”
 - Welcome text
 - Email/Username input field
 - Password input field
 - Login button
 - Signup link
4. Layers were used to organize different elements such as background, text, input fields, and buttons.
5. The base layout was duplicated and modified to create **three different color schemes**:
 - **Pink Theme:** Soft pink background with bright login button
 - **Blue Theme:** Light blue background with dark header and blue button
 - **Orange Theme:** Warm orange background with orange button
6. Each design was exported as a separate image file.
7. The layouts were shown to users, and feedback was collected regarding:
 - Visual appeal

- Readability
- Ease of use

OBSERVATION:

Most users preferred the **blue theme** because it appeared more clean, simple, and easy to read.

RESULT:

The experiment showed that color selection plays an important role in improving user experience and interface design.

CONCLUSION:

A well-chosen color scheme enhances both usability and appearance of an application. Simple and balanced designs are more effective.
