

Exercise 6: UI Design Lifecycle using RAD Model

Project Name: Cab Booking Application

Tool Used: Axure RP

AIM

To demonstrate the lifecycle stages of User Interface (UI) design using the **Rapid Application Development (RAD)** model and to develop an interactive prototype for a Cab Booking Application.

PHASE 1: Requirements Planning

In this initial stage, the core functional requirements for the Cab Booking App were identified to ensure a seamless user journey from booking to payment.

- **User Goals:** Easy location input, vehicle selection, and transparent fare estimation.
 - **Key Features Identified:**
 - **Pickup/Drop Entry:** Input fields for trip coordinates.
 - **Vehicle Selection:** Comparison of categories (Mini, Sedan, SUV) and pricing.
 - **Driver Identification:** Displaying driver name, car number, and ratings.
 - **Real-time Tracking:** A map interface to show driver arrival.
 - **Payment Integration:** Multiple options including Cash, UPI, and Card.
 - **Ride History:** A log of past trips and fares.
-

PHASE 2: User Design (Wireframing & Prototyping)

Using Axure RP, the conceptual requirements were converted into a visual layout.

1. Wireframe Creation:

- **Home Screen:** Designed with two text fields for "Pickup" and "Drop" and a "Find Ride" CTA.
- **Category Selection:** A grid layout displaying vehicle icons (Mini, Sedan, SUV) with dynamic price labels (e.g., ₹370, ₹530, ₹750).

- **Driver Details:** A centered layout showing "Rajesh Kumar" and car plate "TN 09 AB 1234".

2. Adding Interactions:

- **Onclick Events:** Linked the "Find Ride" button to the Vehicle Selection page.
- **Navigation:** Implemented "Back" buttons on every screen to ensure user flow control.
- **State Changes:** Used buttons like "Confirm Booking" to trigger the "Ride Booked Successfully" confirmation.

3. Masters & Reusable Elements:

- Created a **Header Master** ("Cab Booking App" with a black background) to maintain consistency across all 7 screens.

PHASE 3: Construction

This phase involved refining the static wireframes into a high-fidelity interactive prototype.

• Interactive Elements:

- **Dynamic Panels:** Used to simulate the "Map" loading and status updates (e.g., "Arriving in 5 mins").
- **Radio Groups:** Implemented in the Payment screen to ensure only one payment method (Cash/UPI/Card) can be selected at a time.

• Iterative Testing:

- The "Preview" function in Axure was used to simulate the user journey from Chennai Central to T Nagar.
- Adjustments were made to the button sizes and font readability (specifically the "Book Your Ride" stylized font) based on visual feedback.

PHASE 4: Cutover

The final stage focuses on the transition from prototype to a deployable design specification.

1. **Final Export:** The project was published to **Axure Cloud**, generating a shareable URL for stakeholder review.

2. **User Documentation:** A brief walkthrough was prepared, explaining the flow from the "Find Ride" screen to the "Ride History" log (showing dates like 15 Mar 2026).
 3. **Final UI Specification:**
 - **Primary Action Color:** Sky Blue (#87CEFA) for buttons.
 - **Typography:** Mixed use of Serif for headers and Sans-serif for body text.
-

RESULT

The interactive prototype for the Cab Booking App was successfully developed using Axure RP. The RAD model allowed for quick iterations between the design and construction phases, resulting in a user-friendly interface that covers the entire booking lifecycle.
